# **Introduction**

---

# Relevance of NPIs

- The most prominent theory of NPIs (Ladusaw, 1979 and subsequent work) explains their licensing as inference markers
  - Downward entailment (DE) environments
  - Downward inferences (DI)
- Our experimental research supports the hypothesis of Szabolcsi et al. (2008) and Barker (2018):
  - Double licensing (DL) of NPIs in Czech
  - Inferences triggered in DL environments
  - **NPIs are unreliable indicators of downward inferences**

## Research Question

- (1) RQ: Do NPIs in double licensing environments correlate with facilitating downward inferences?

## Methodology

---

# Double Licensing Environments

- **Double licensing environments:** NPI licensing varies in such contexts
  - Despite being intuitively upward entailing
  - Schmerling (1971); Barker (2018); Homer (2021)
- DL often fails when licensors are syntactically close
  - Homer (2021); Mayer et al. (2019)

# Experimental Design

**2 experiments** (both acceptability judgment tasks):

- 7-point Likert scale
- Online on *L-Rex* platform
- 57 (out of 70) native Czech speakers
- Two versions with reversed order to control for order effects

## **Experiment 1: NPI Licensing in DL Environments**

1×3 design:

- BASELINE,
- DOUBT-NEG,
- NEG-DOUBT

## **Experiment 2: Inference Reasoning**

2×2 design:

- DE-DOWN,
- DE-UP,
- UE-DOWN,
- UE-UP

## **Experimental Items**

---

# Experiment 1 Examples

## BASELINE:

- (2) Policie **ne-má** *sebemenší důvod* tu stopu  
Police neg-have.3sg slightest reason that.acc trail.acc  
zahladit.  
cover.  
'The police have no reason to cover the trail.'

## DOUBT-NEG:

- (3) Petr **pochybuje**, [že policie **ne-má** *sebemenší důvod* tu stopu zahladit].  
Petr doubt.3sg that police neg-have.3sg slightest reason that.acc trail.acc cover.  
'Petr doubts that the Police have no reason to cover the trail.'

## Experiment 1 Examples (cont.)

### NEG-DOUBT:

- (4) Petr **ne-pochybuje**, [že policie má *sebemenší důvod* tu stopu zahladit].  
Petr neg-doubt.3sg that police have.3sg slightest reason that.acc trail.acc cover.  
'Petr does not doubt that the Police have the slightest reason to cover the trail.'

## Experiment 2 Examples

### DE conditions:

- (5) Petr **pochybuje**, [že si Marie **ne**-pořídila  
‘Peter doubts that Marie didn’t get  
kočku]. Petr doubt.3sg that refl Marie neg-got.3sg  
a cat.’  
cat.acc.
- a. → siamese cat [DE-DOWN]  
b. → animal [DE-UP]

## UE conditions:

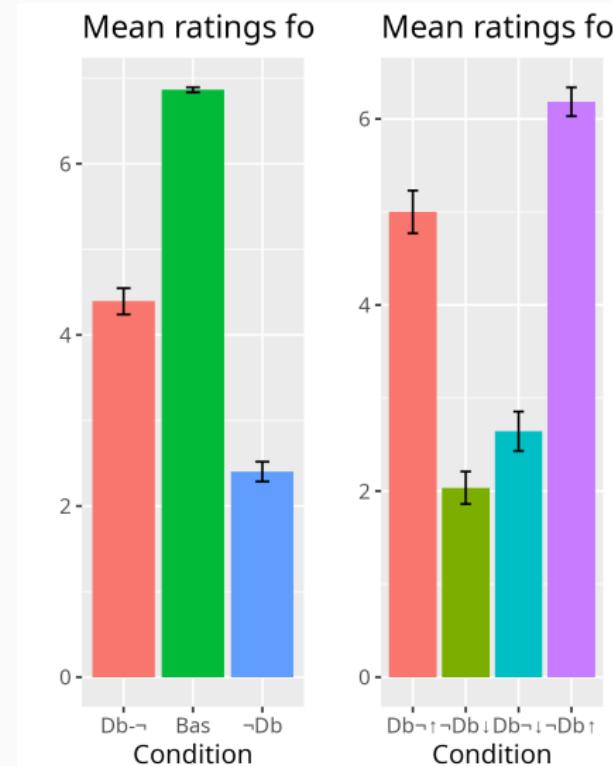

- (6) Petr **ne-pochybuje**, [že si Marie pořídila kočku].  
Petr neg-doubt.3sg that refl Marie got.3sg cat.acc.  
'Petr does not doubt that Marie has got a cat.'
- a. → siamese cat [UE-DOWN]
  - b. → animal [UE-UP]

# **Results**

---

# Descriptive Statistics

**Figure 1:** Acceptability and Inferences in DL environments

# Statistical Models

Bayesian linear regression models in *rstanarm*:

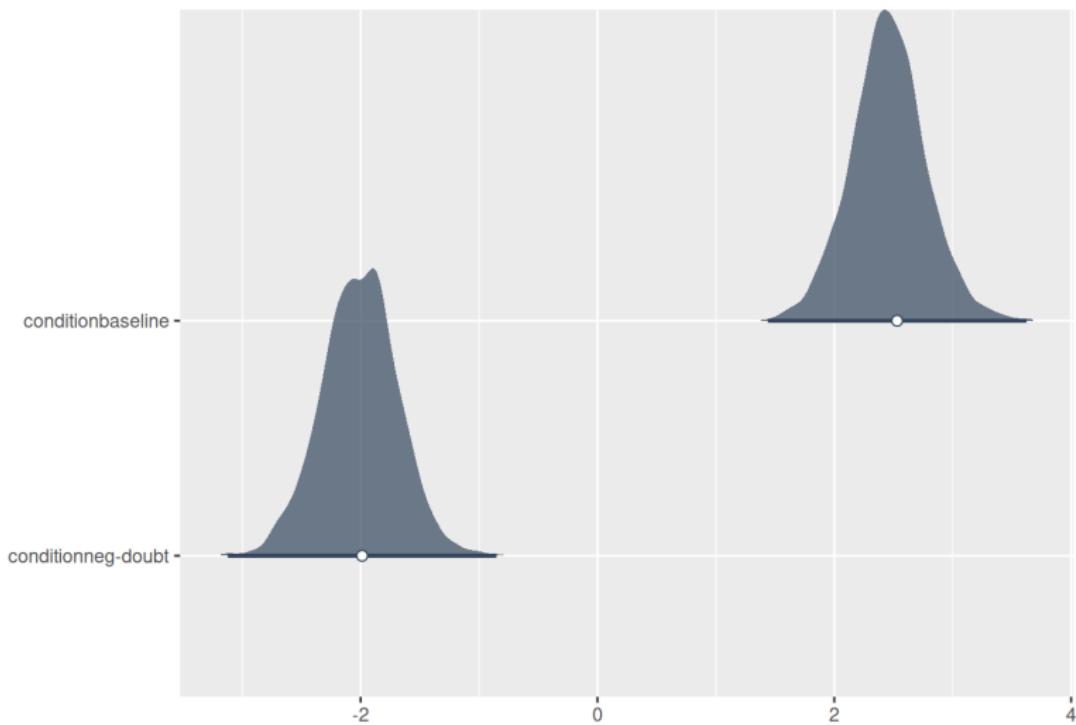

## Model 1 (NPI Licensing):

- BASELINE more natural than DOUBT-NEG  $\hat{\beta} = 2.46$ , BF 1.01e+18)
- NEG-DOUBT less natural ( $\hat{\beta} = -1.98$ , BF 2.25e+15)

## Model 2 (Inferences):

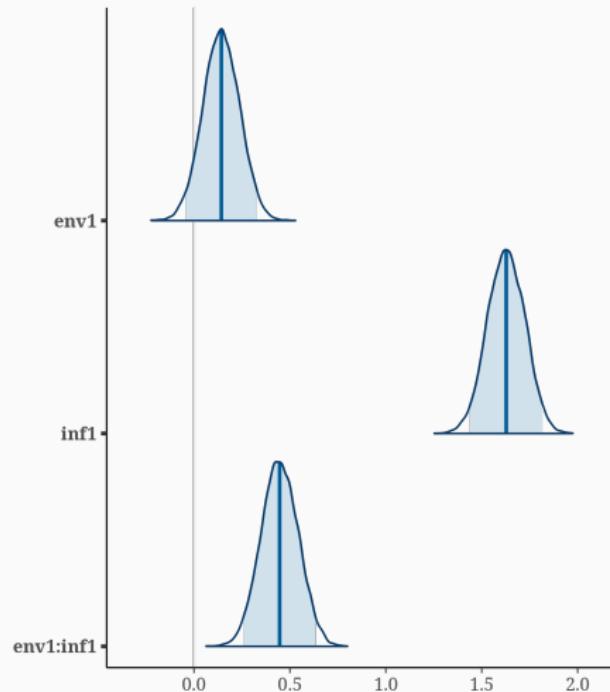

- Upward inferences strongly preferred (INF:  $\hat{\beta} = 1.63$ , BF 1.38e+16)
- No effect of negation position (ENV:  $\hat{\beta} = 0.14$ , BF 0.044)
- **Intriguing interaction INF × ENV!**

## Posterior Samples

**Figure 2:** Exp1

Posterior distributions  
with medians and 95% intervals

**Figure 3:** Exp2

## **Discussion**

---

# Key Findings

- **Support for Homer's (2021) environment-based approach:**
  - DL is acceptable when NPIs occur with their licensor (DOUBT-NEG)
- **Upward inferences always preferred**
  - Regardless of negation position across domains
- **Answer to research question:**
  - NPIs licensing in DL environments doesn't correlate with downward inference facilitation

# Correlation Analysis

- Normalized correlations between Exp1 and Exp2 conditions:
  - **No credible link** between NPI licensing and inferences
  - Unlike Denić et al. (2021)
  - Only hint: interaction INF  $\times$  ENV ( $\hat{\beta} = 0.45$ , BF 171)
    - weaker UP inference in (5-a): 'doubt that Marie didn't get a cat', also the more acceptable (from the two non-baseline conditions) condition in Exp1

## Theoretical Implications

### **Experimental support of Szabolcsi et al. (2008):**

- NPIs signal narrow scope w.r.t. their licensor (Barker, 2018)
- In DL environments: NPIs remain indicators of narrow scope within their local polarity domain

## Barker's (2018) NPI scope licensing:

- In DL cases: NPI licensed in embedded clause
- Wide scope does not entail narrow scope:

$$(7) \quad \exists[\text{REASON}(x) \wedge \neg\text{POLICECOVERS}(x)] \not\models \neg\exists[\text{REASON}(x) \wedge \text{POLICECOVERS}(x)]$$

## Theoretical Implications (cont.)

**NPIs mark narrow scope but are not necessarily good signals of inferences**

**Overall alignment:**

- More with Szabolcsi et al. (2008) and Barker (2018)
- Than with claims of DI-NPI link (Chemla et al., 2011; Denič et al., 2021; Ladusaw, 1979)

## **Bayesian analysis shows:**

- Strong main effects but weaker interaction effect
- Supports view that NPIs are grammaticalized in DI environments
- But DI is not synchronically necessary for them (Herburger, 2023)

## Conclusion

---

# Summary

- **Double licensing environments** reveal complex NPI behavior
- **NPIs are unreliable indicators** of downward inferences
- **Scope-based theories** better explain the data than inference-based theories
- **Czech experimental evidence** supports cross-linguistic theoretical claims about NPIs being multi-faceted but at the core markers of scope (DE marking was maybe a historical fact but not a synchronic necessity)
